Crowdsourcing Genome Wide Association Studies

Bastian Greshake and Philipp Bayer

28.12.2011

Overview

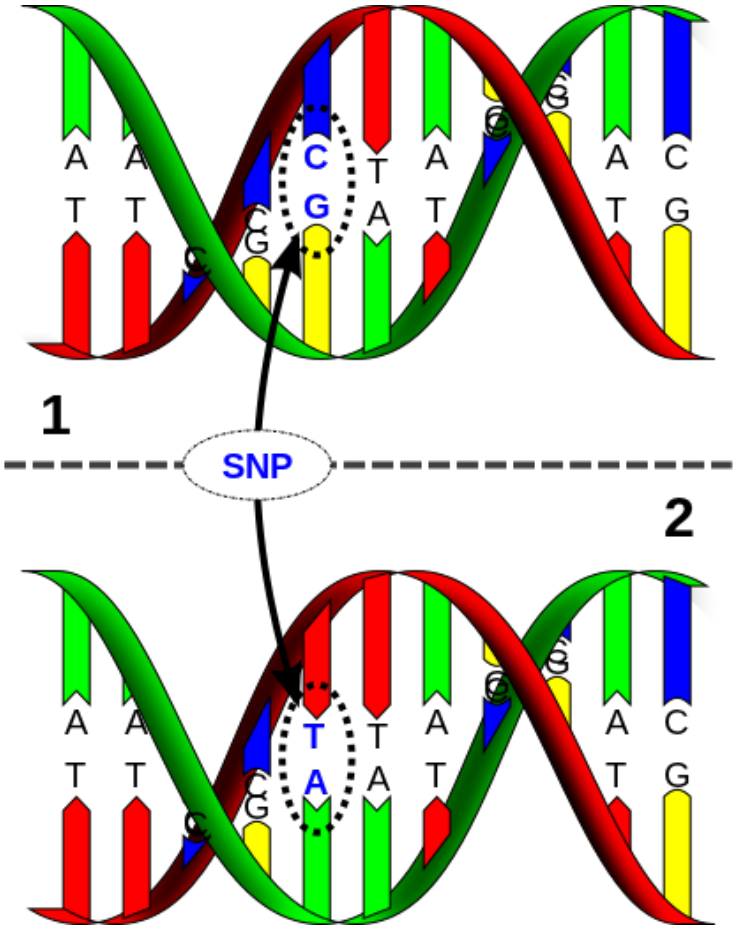
What are GWAS?

- Genome-wide Association Studies

What are GWAS?

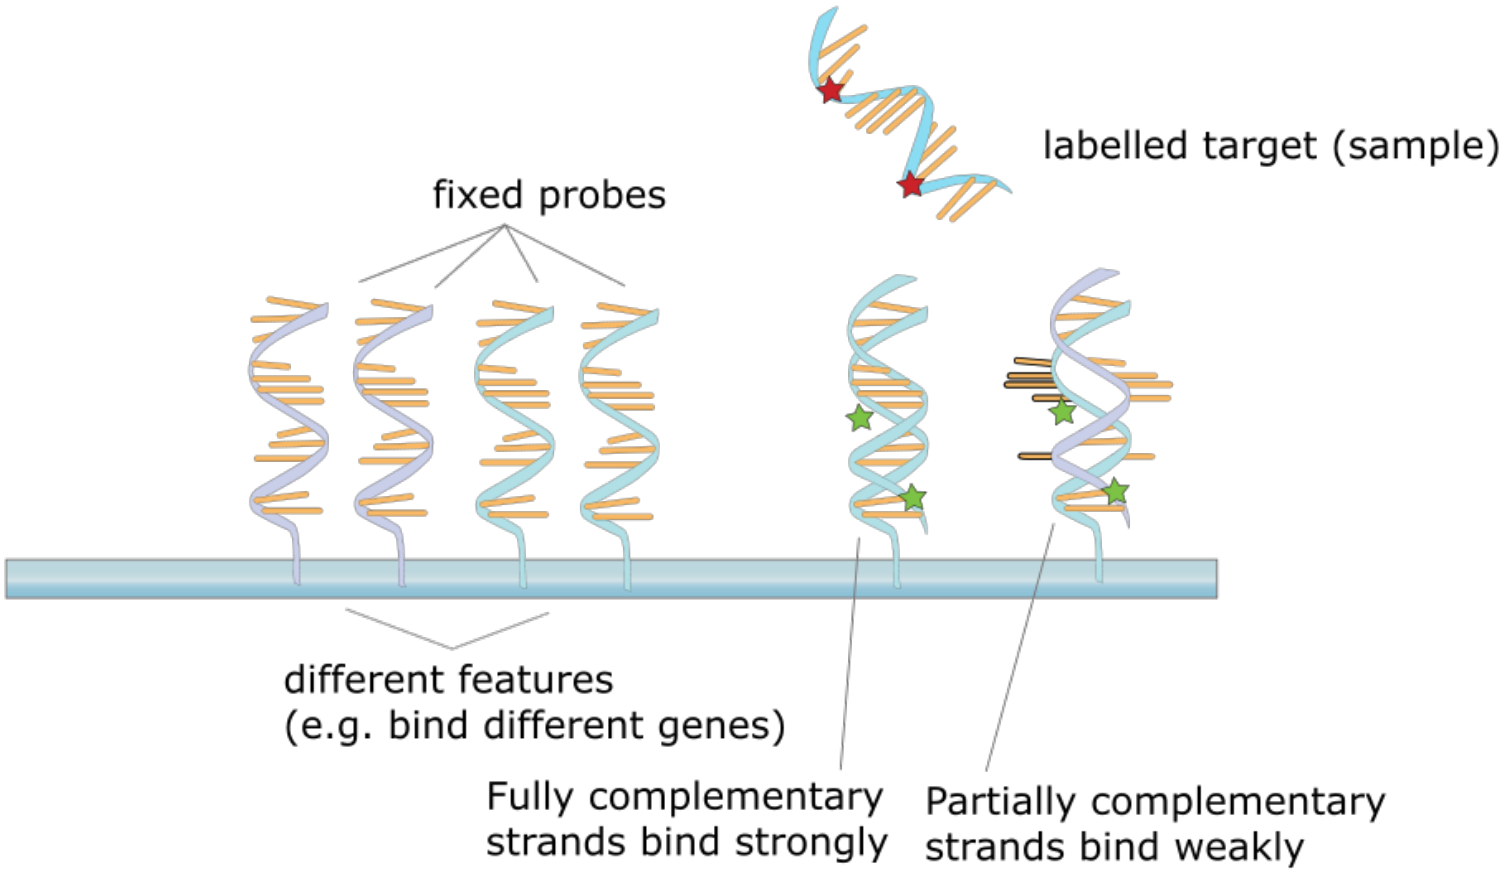
- Genome-wide Association Studies
- Link genetic variants (SNPs) to certain traits like eye or hair colour or to diseases like Diabetes, types of cancer

Single Nucleotide Polymorphism



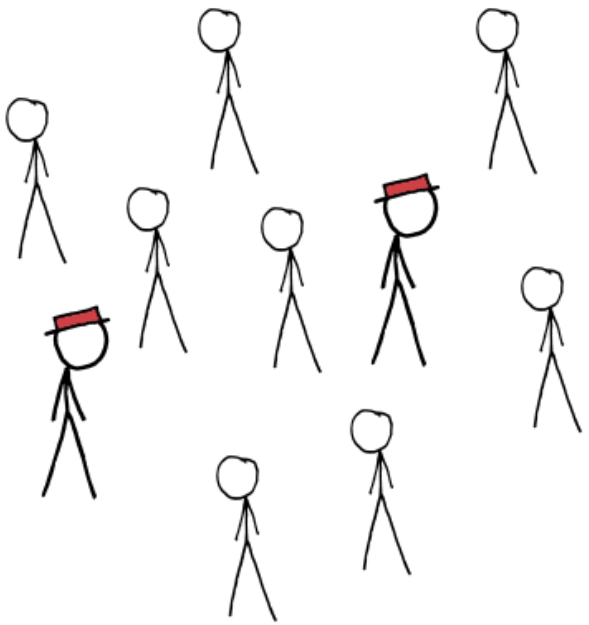
Source: http://en.wikipedia.org/wiki/File:Dna-SNP.svg

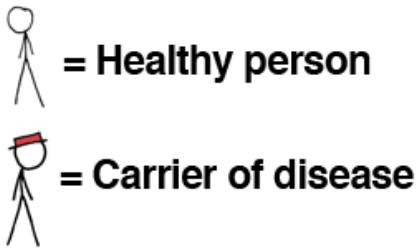
How to analyse SNPs?



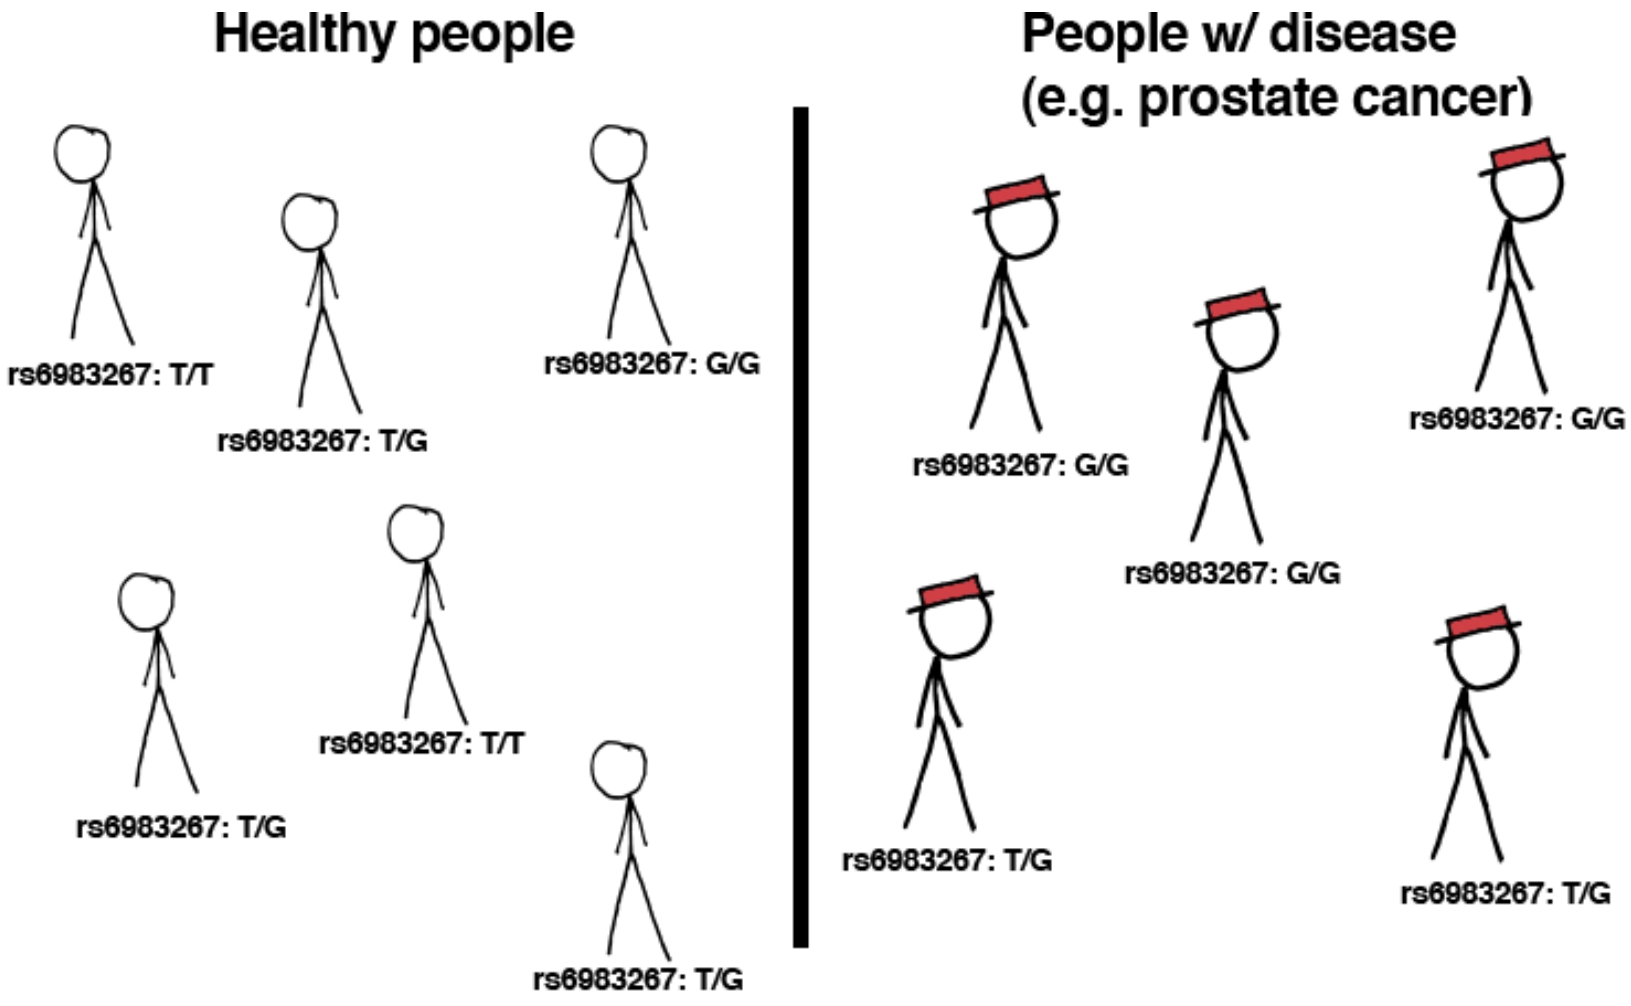
Source: http://en.wikipedia.org/wiki/File:NA_hybrid.svg

How do GWAS work?

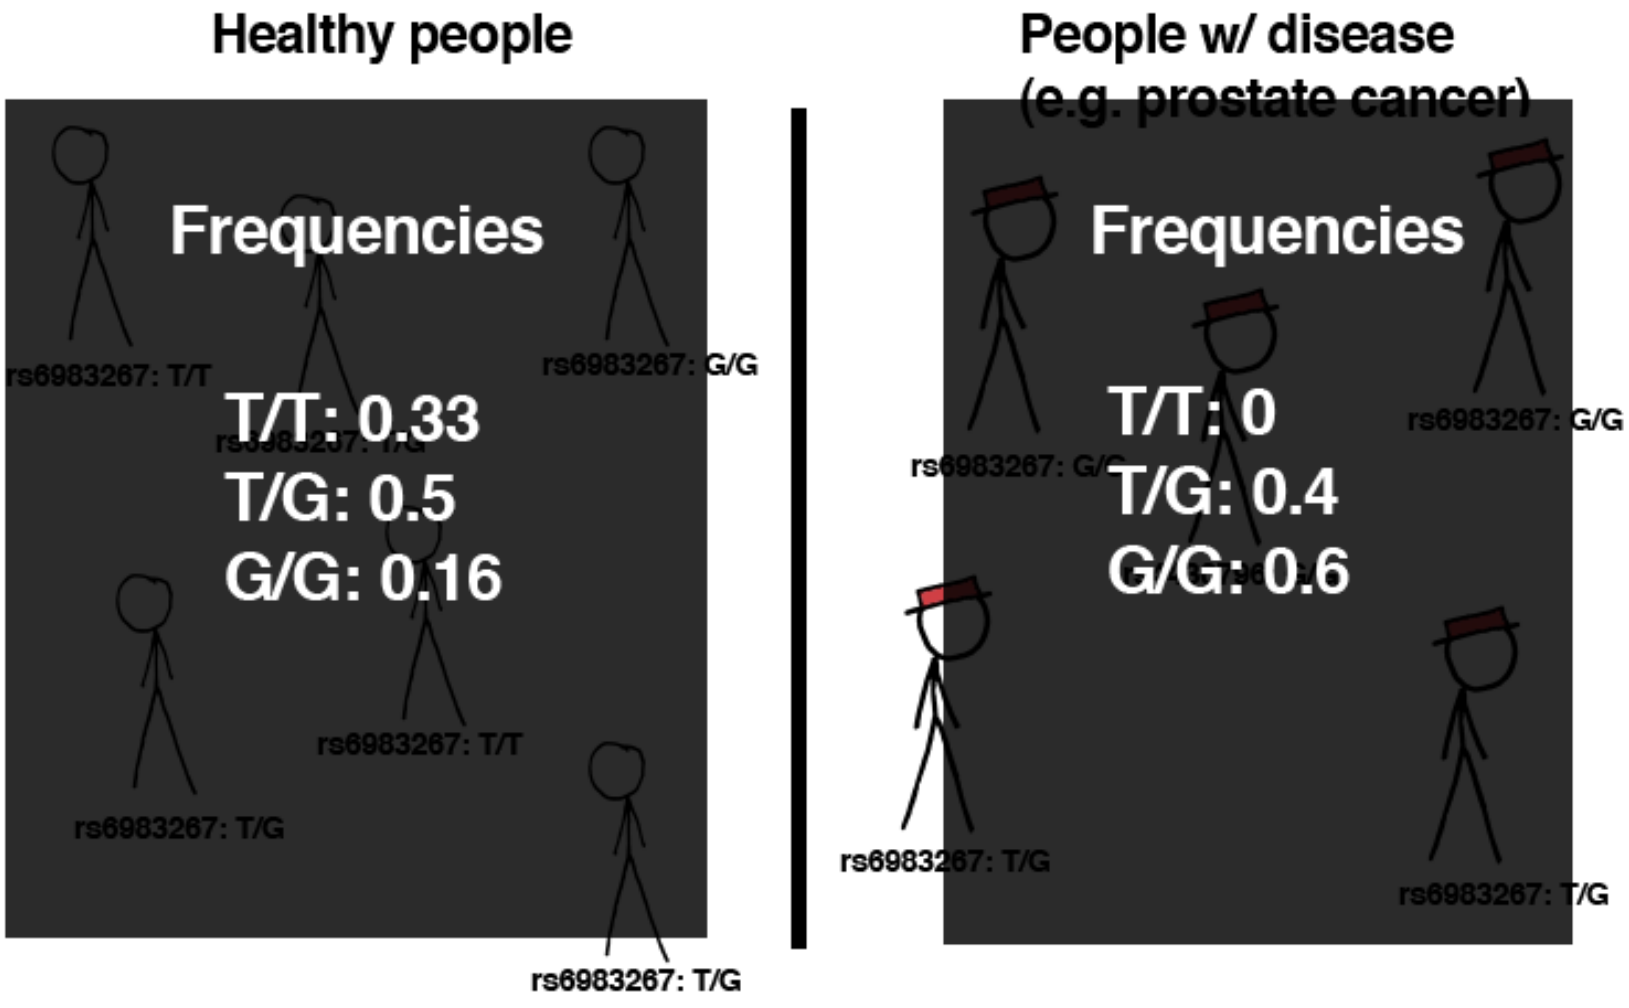




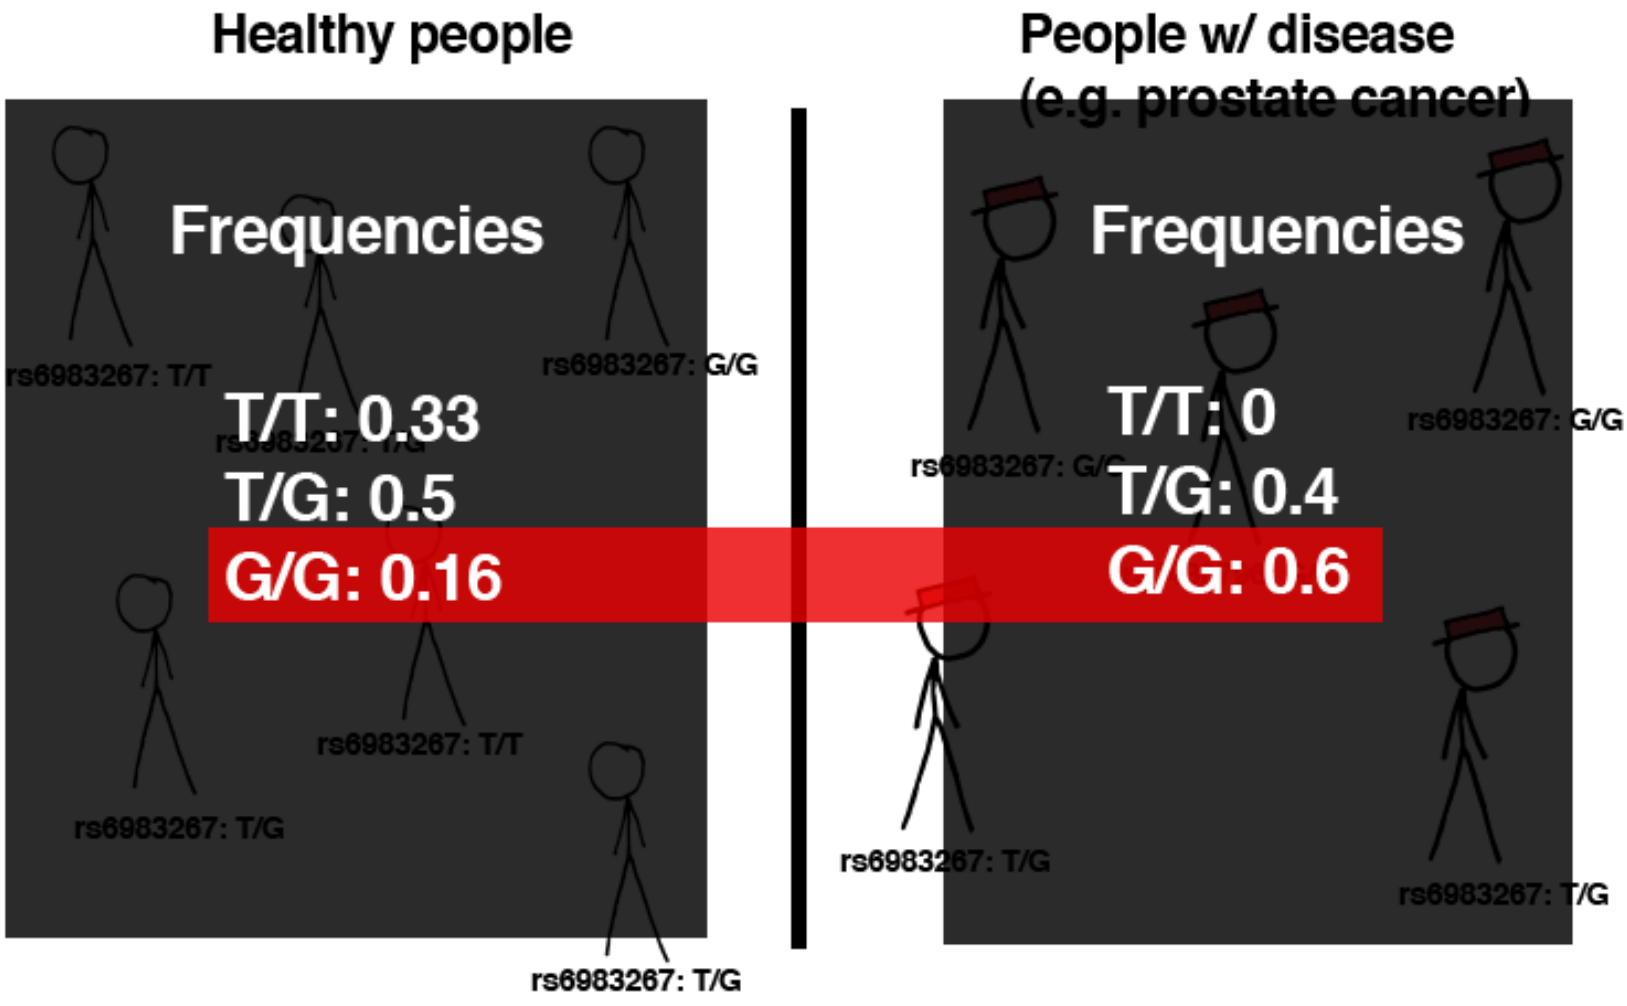
How do GWAS work?



How do GWAS work?



How do GWAS work?



Some GWAS-examples

- Sladek *et al.* (2007) identified four gene locations linked to heightened type 2 diabetes risk

Some GWAS-examples

- Sladek *et al.* (2007) identified four gene locations linked to heightened type 2 diabetes risk
- Kogan *et al.* (2011) linked rs53576 (G:G) to pro-social behaviour

Some GWAS-examples

- Sladek *et al.* (2007) identified four gene locations linked to heightened type 2 diabetes risk
- Kogan *et al.* (2011) linked rs53576 (G:G) to pro-social behaviour
- The Wellcome Trust Case Control Consortium (2007) linked 24 locations to 7 major diseases

Problems with GWAS

- Large enough sample size

Problems with GWAS

- Large enough sample size
- Correcting for multiple testing

Problems with GWAS

- Large enough sample size
- Correcting for multiple testing
- Correlation != Causation

Putting GWAS to use

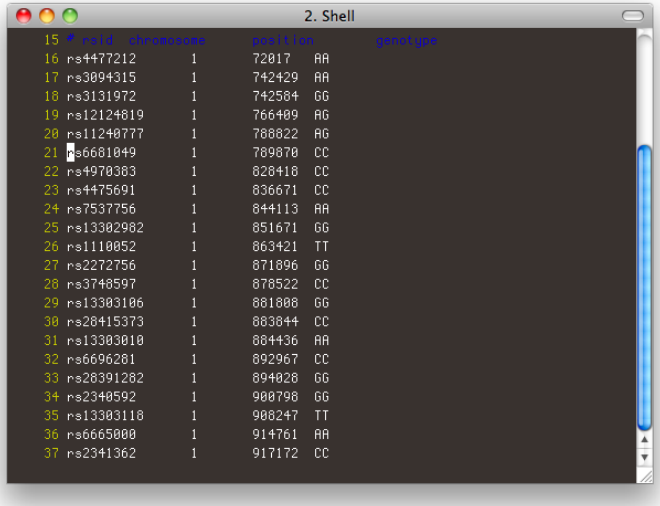
- Direct-To-Consumer genetic testing
- Analyse about 1 million SNPs and provide summary of disease risks & ancestry
- About $200 for a genotyping

Putting GWAS to use

- Direct-To-Consumer genetic testing
- Analyse about 1 million SNPs and provide summary of disease risks & ancestry
- About $200 for a genotyping
- Providers: 23andMe, deCODEme, FamilyTree DNA, ...

Putting GWAS to use

- Direct-To-Consumer genetic testing
- Analyse about 1 million SNPs and provide summary of disease risks & ancestry
- About $200 for a genotyping
- Providers: 23andMe, deCODEme, FamilyTree DNA, ...
- You get access to the raw data!



Numbers on DTC

- 23andMe alone has over 100.000 customers

Numbers on DTC

- 23andMe alone has over 100.000 customers
- 76 % of their customers agree to participate in research

Numbers on DTC

- 23andMe alone has over 100.000 customers
- 76 % of their customers agree to participate in research
- 59 % of them share phenotypic information with 23andMe

Research in company labs

- 23andMe published results of studies with up to 30.000 participants

Research in company labs

- 23andMe published results of studies with up to 30.000 participants
- Replication of older GWAS

Research in company labs

- 23andMe published results of studies with up to 30.000 participants
- Replication of older GWAS
- Finding new associations for Parkinsons disease

Data sharing

- People are already sharing the raw data of DTC tests

Data sharing

- People are already sharing the raw data of DTC tests
- 1-5 % of 23andMe customers would be enough to perform simple GWAS

Data sharing

- People are already sharing the raw data of DTC tests
- 1-5 % of 23andMe customers would be enough to perform simple GWAS
- The *Personal Genome Project*: Open data, but closed participation

Willing to share?

What can happen to your open data?

- Positive and negative consequences

What can happen to your open data?

- Positive and negative consequences
  - Possibly extremely bad consequences

What can happen to your open data?

- Positive and negative consequences
  - Possibly extremely bad consequences
- Up to you to decide whether you want to open your data

Positive consequences

- More knowledge about yourself

Positive consequences

- More knowledge about yourself
- Cheap, open science

Positive consequences

- More knowledge about yourself
- Cheap, open science
- Great data-source for citizen scientists

Negative consequences

- People know more about you than you might like

Negative consequences

- People know more about you than you might like
  - Including your boss, insurance company, government...

Negative consequences

- People know more about you than you might like
  - Including your boss, insurance company, government...
- Knowledge isn't static: Future research could show new, negative (or positive) associations.

Negative consequences

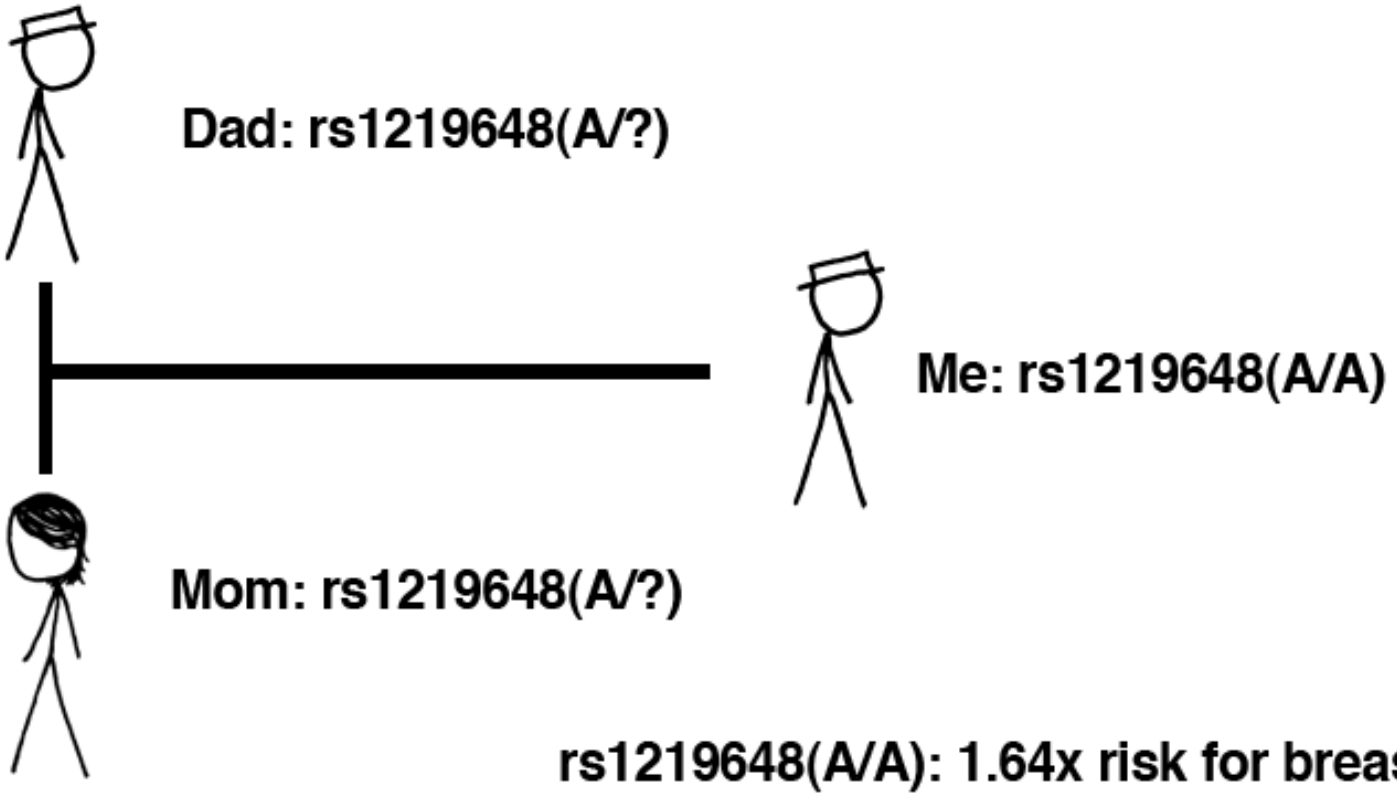
- People know more about you than you might like
  - Including your boss, insurance company, government...
- Knowledge isn't static: Future research could show new, negative (or positive) associations.
- Personal SNPs very similar to parents and relatives

Somebody Else's Problem? A case study

Me: rs1219648(A/A)

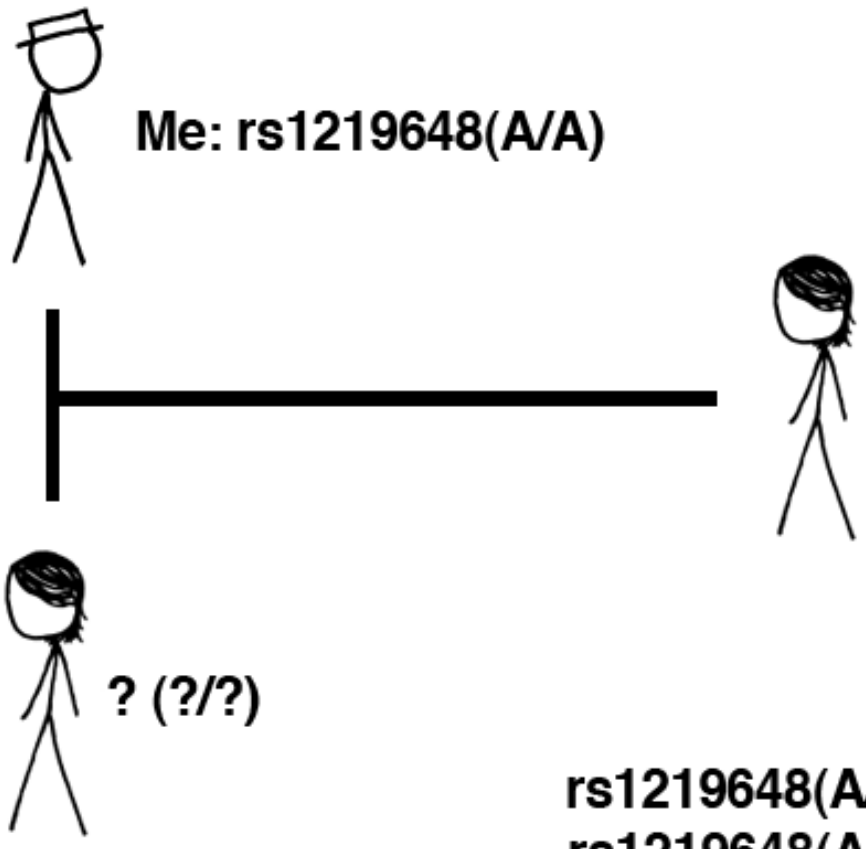
rs1219648(A/A): 1.64x risk for breast cancer
rs1219648(A/G): 1.20x risk for breast cancer
rs1219648(G/G): "normal" risk

Somebody Else's Problem? A case study



rs1219648(A/A): 1.64x risk for breast cancer
rs1219648(A/G): 1.20x risk for breast cancer
rs1219648(G/G): "normal" risk

Somebody Else's Problem? A case study



rs1219648(A/A): 1.64x risk for breast cancer
rs1219648(A/G): 1.20x risk for breast cancer
rs1219648(G/G): "normal" risk

Possible Solutions

- What about laws?

Possible Solutions

- What about laws?
  - US: Genetic Information Nondiscrimination Act (GINA, 2008)

Possible Solutions

- What about laws?
  - US: Genetic Information Nondiscrimination Act (GINA, 2008)
  - Germany: Gendiagnostikgesetz (GenDG, 2010)

Open GWAS

- No central repository for open genotypings!

Open GWAS

- No central repository for open genotypings!
- We've created openSNP.org

Open GWAS

- No central repository for open genotypings!
- We've created openSNP.org
- open source repository for CC0-genotypings from 23andme, deCODEme and others

Open GWAS

- No central repository for open genotypings!
- We've created openSNP.org
- open source repository for CC0-genotypings from 23andme, deCODEme and others
- Allows users to annotate with phenotypes (hair colour, nicotine dependence...)

Open GWAS

- No central repository for open genotypings!
- We've created openSNP.org
- open source repository for CC0-genotypings from 23andme, deCODEme and others
- Allows users to annotate with phenotypes (hair colour, nicotine dependence...)
- Everybody can download everything

Open GWAS

- No central repository for open genotypings!
- We've created openSNP.org
- open source repository for CC0-genotypings from 23andme, deCODEme and others
- Allows users to annotate with phenotypes (hair colour, nicotine dependence...)
- Everybody can download everything
- So far: 78 genotypings and 188 users

Conclusions

- Open GWAS are the future of personalised medicine

Conclusions

- Open GWAS are the future of personalised medicine
- It's in the hands of users to make or break the situation

Conclusions

- Open GWAS are the future of personalised medicine
- It's in the hands of users to make or break the situation
- Chance to take science into our own hands

Future of openSNP

- We've won the PLoS/Mendeley Binary Battle

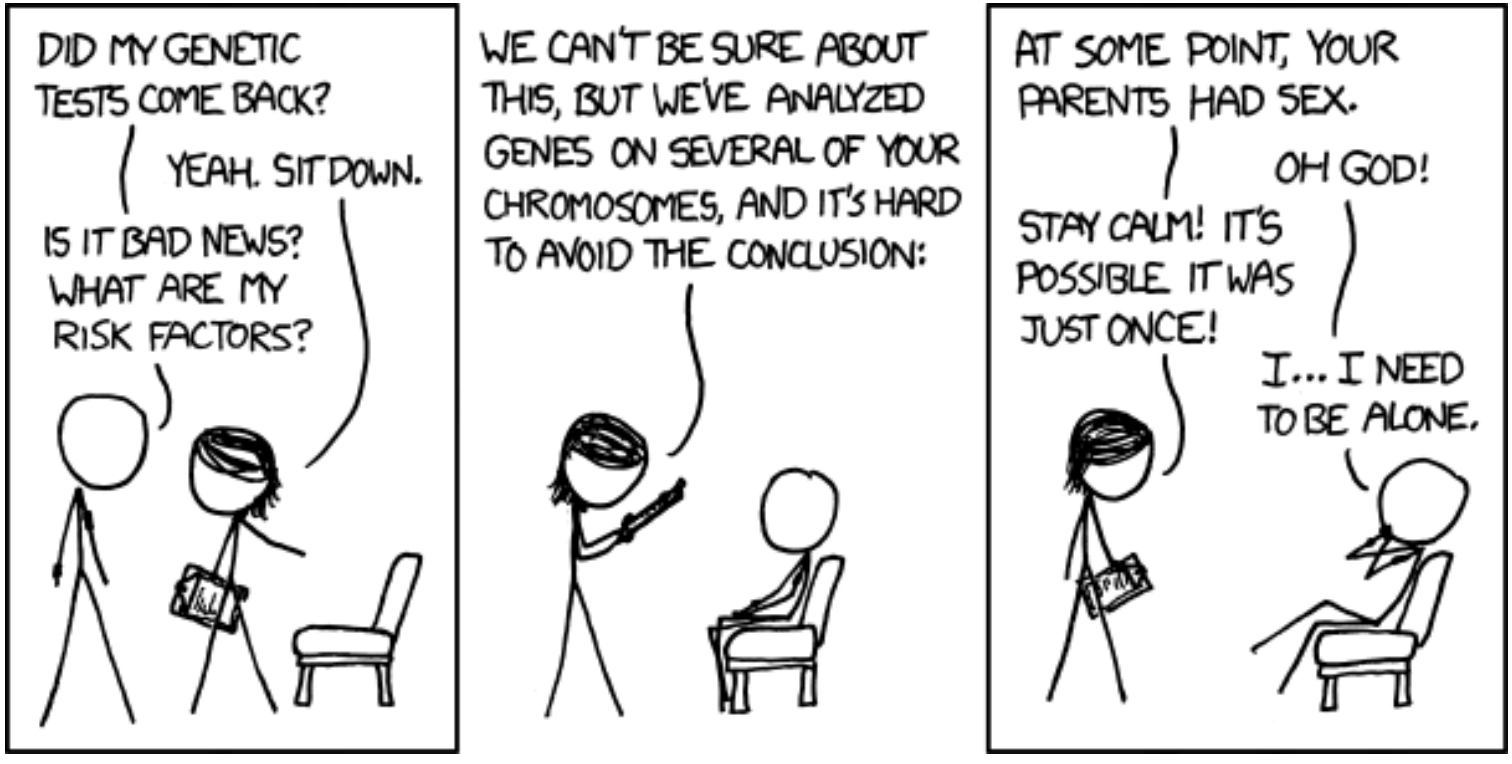
Future of openSNP

- We've won the PLoS/Mendeley Binary Battle
- Constantly improving the project

Future of openSNP

- We've won the PLoS/Mendeley Binary Battle
- Constantly improving the project
- Trying to get funds for free genotypings

The end



Thanks for listening. Any questions?
